

Git Commands - Basic

Action	Purpose	Command
Initialize repository	Create a new local Git repo	<code>git init</code>
Check status	See modified, staged, and untracked files	<code>git status</code>
Fetch remote changes	Update <code>origin/main</code> without touching local files	<code>git fetch</code>
Show changed files vs remote	See which files changed on GitHub	<code>git diff --name-only main origin/main</code>
Show full diff vs remote	Compare local vs remote code	<code>git diff main origin/main</code>
Pull updates	Merge remote changes into local branch	<code>git pull</code>
Stage all changes	Prepare all modified files for commit	<code>git add .</code>
Stage specific file	Add only one file	<code>git add filename.ext</code>
Commit changes	Save your work with a message	<code>git commit -m "message"</code>
Push to GitHub	Upload commits to remote	<code>git push</code>
View commit history	Clean, visual commit history	<code>git log --oneline --graph --decorate</code>
Clone a repo	Download a remote repo	<code>git clone <url></code>
Change remote URL	Point <code>origin</code> to a new GitHub repo	<code>git remote set-url origin <new-url></code> E.g. <code>https://github.com/silverpascalcoder/test-lab.git</code>
